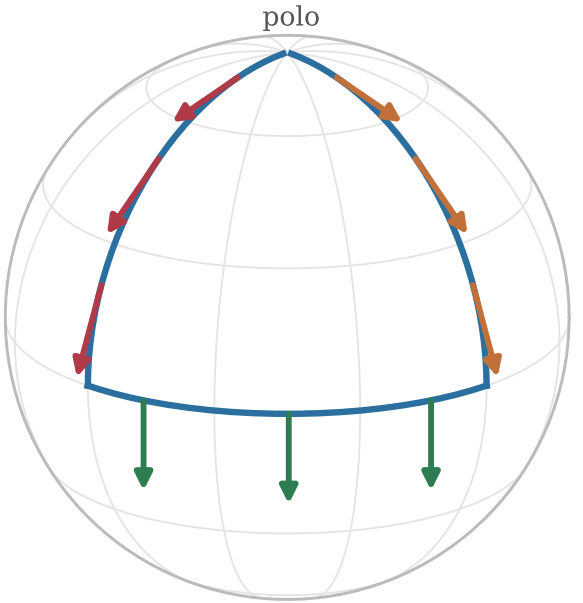
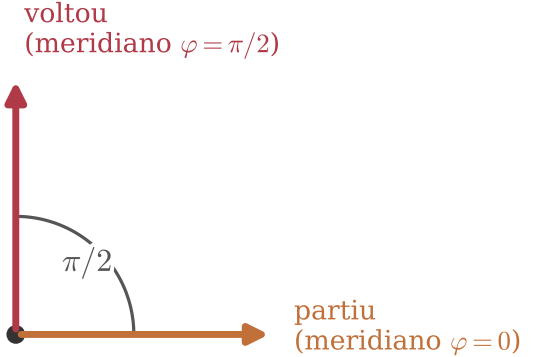
(a) as três pernas



o vetor é sempre $\vec{e}_\theta$:
tangente aos meridianos, normal ao equador

(b) no polo, comparando direções



$$\text{holonomia} = \frac{\text{área}}{a^2} = \frac{4\pi a^2/8}{a^2} = \frac{\pi}{2}$$

as componentes coordenadas, porém,
são $(1, 0)$ nos dois casos: a base girou junto
